Eddie,

Please work with Michael and team to explain our current storage configuration for send a file and request a quote. We simply need to mimic that on the new websites.

Best,

Christian

SSI and PIP web sites use a virtual directory in IIS on each web server for access to the network share.

Below is an example from pmgws01 for SSI. We can do the same thing for the new sites.

So, it sounds like once that is set up, we can point the file saving mechanism to this new virtual directory. Uttam and I will assess here on this end later today to be sure / reach out with any questions.

Thanks for the information Eddie!

- Michael

Sure Michael. To expand on the current setup further...paperthin set up their service account to use domain logon credentials. I noticed that all the Ektron service accounts are using Local System logon credentials. Somehow the application would need to authenticate to the network share.

Thanks - yes, authentication crossed my mind. I will review the .Net mechanism currently used in the current set up with Uttam (Partly to ensure this request is as straight forward as I think it is). I appreciate all this info ahead of time :)

Michael,

By default Ektron saves all the uploaded images & uploaded files into one of the following directories by default and we can change the product default design.

\\uploadedimages\
\\uploadedfiles\
\\assets\
\\privateassets\

Only DMS (document management system) files saved path can be changed and also on the site & email body, if the client wants to download then those files should be accessible by the web site and not sure their if we use the shared drive then it is possible or not. So I have to test this out before we confirm with client.

Regards,
Uttam
